# 1 Approximations

## 1.1 Law of Large Numbers

 $\mu$  and variance  $\sigma^2$ .  $\overline{X_n} = \frac{1}{n} \sum_{i=1}^n X_i \xrightarrow{\infty}$  $\mu$ . Let  $x_1, x_2, ..., x_n$  be realisations of the random variable  $X_1, X_2, ..., X_n$ , then  $\overline{x_n} =$  $\frac{1}{n}\sum_{i=1}^n x_i \xrightarrow{\infty} \mu$ 

### 1.2 Central Limit Theorem

Let  $S_n = \sum_{i=1}^n X_i$  where  $X_1, X_2, ..., X_n$  IID  $\frac{S_n - n\mu}{\sqrt{n}\sigma} \xrightarrow{\infty} \mathcal{N}(0,1)$ 

## Distributions

### 2.1 Poisson( $\lambda$ )

$$Pr(X = k) = \frac{\lambda^k e^{-\lambda}}{k!}, k = 0, 1, \dots$$
  
$$E(X) = Var(X) = \lambda$$

## **2.2** Normal $X \sim \mathcal{N}(\mu, \sigma^2)$

$$f(x) = \frac{1}{\sqrt{2\pi}\sigma} exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right), -\infty < x < \infty$$

- 1. When  $\mu = 0$ , f(x) is an even function, and  $E(X^k) = 0$  where k is odd
- 2.  $Y = \frac{X E(X)}{SD(X)}$  is the standard normal

### **2.3 Gamma** Γ

$$\begin{split} g(t) &= \tfrac{\lambda^{\alpha}}{\Gamma(\alpha)} t^{\alpha-1} e^{-\lambda t}, t \geq 0 \\ \mu_1 &= \tfrac{\alpha}{\lambda}, \mu_2 = \tfrac{\alpha(\alpha+1)}{\lambda^2} \end{split}$$

## 2.4 $\chi^2$ Distribution

Let  $\mathcal{Z} \sim \mathcal{N}(0,1)$ ,  $\mathcal{U} = \mathcal{Z}^2$  has a  $\chi^2$  distribution with 1 d.f.

$$f_{\mathcal{U}}(u) = \frac{1}{\sqrt{2\pi}} u^{-\frac{1}{2}} e^{-\frac{u}{2}}, u \ge 0$$

$$\chi_1^2 \sim \Gamma(\alpha = \frac{1}{2}, \lambda = \frac{1}{2})$$
  
Let  $U_1, U_2, ..., U_n$  be  $\chi_1^2$  IID, then  $V = \sum_{i=1}^n U_i$  is  $\chi_2^2$  with n degree freedom,  $V \sim \Gamma(\alpha = \frac{1}{2})$ 

is  $\chi_n^2$  with n degree freedom,  $V \sim \Gamma(\alpha)$  $\frac{n}{2}$ ,  $\lambda = \frac{1}{2}$ )  $E(\chi_n^2) = n, Var(\chi_n^2) = 2n$ 

$$E(\chi_n^2) = n, Var(\chi_n^2) = 2$$
  
 $M(t) = (1 - 2t)^{-\frac{n}{2}}$ 

## 2.5 t-distribution

Let  $\mathcal{Z} \sim \mathcal{N}(0,1)$ ,  $\mathcal{U}_n \sim \chi_n^2$  be independent,  $t_n = \frac{z}{\sqrt{U_n/n}}$  has a t-distribution with n d.f.

$$f(t) = \frac{\Gamma([(n+1)/2])}{\sqrt{n}\pi\Gamma(n/2)} \left(1 + \frac{t^2}{n}\right)^{-\frac{n+1}{2}}$$

1. t is symmetric about 0

$$2. \ t_n \xrightarrow[n]{\infty} \mathcal{Z}$$

### 2.6 F-distribution

Let  $X_1, X_2, ..., X_n$  be IID, with expectation  $\frac{U/m}{V/n}$  has an F distribution with (m,n) d.f. If  $X \sim t_n$ ,  $X^2 = \frac{Z/1}{U_n/n}$  is an F distribution with (1,n) d.f, with w > 0:  $f(w) = \frac{\Gamma([(n+1)/2])}{\Gamma(m/2)\Gamma(n/2)} \frac{m}{n}^{\frac{m}{2}} w^{\frac{m}{2} - 1} \left(1 + \frac{m}{n} w\right)^{-\frac{m+n}{2}}$ For n > 2,  $E(W) = \frac{n}{n-2}$ 

# Sampling

Let  $X_1, X_2, ..., X_n$  be IID  $\mathcal{N}(\mu, \sigma^2)$ . sample mean,  $\overline{X} = \frac{1}{n} \sum_{i=1}^{n} X_i$ sample variance,  $S^2 = \frac{1}{n-1} \sum_{i=1}^{n} (X_i - \overline{X})^2$ 

## 3.1 Properties of $\overline{X}$ and $S^2$

- 1.  $\overline{X}$  and  $S^2$  are independent
- 2.  $\overline{X} \sim \mathcal{N}(\mu, \frac{\sigma^2}{n})$
- 3.  $\frac{(n-1)S^2}{\sigma^2} \sim \chi^2_{n-1}$
- 4.  $\frac{\overline{X} \mu}{S/\sqrt{n}} \sim t_{n-1}$

## 3.2 Simple Random Sampling (SRS)

Assume n random draws are made without replacement. (Not SRS, will be corrected for later).

## 3.2.1 Summary of Lemmas

- $P(X_i = \xi_i) = \frac{n_j}{N}$ : Lemma A
- For  $i \neq j$ ,  $Cov(X_i, X_i) = -\frac{\sigma^2}{N-1}$ : Lemma B

## 3.2.2 Estimation Problem

Let  $X_1, X_2, ..., X_n$  be random draws with replacement. Then  $\overline{X}$  is an estimator of  $\mu$ . and the observed value of  $\overline{X}$ ,  $\overline{x}$  is an estimate of  $\mu$ 

## 3.2.3 Standard Error (SE)

SE of an  $\overline{X}$  is defined to be  $SD(\overline{X})$ .

param	est	SE	Est. SE
$\mu$	$\overline{X}$	$\frac{\sigma}{\sqrt{n}}$	$\frac{s}{\sqrt{n}}$
p	$\hat{p}$	$\sqrt{\frac{p(1-p)}{n}}$	$\sqrt{\frac{\hat{p}(1-\hat{p})}{n-1}}$

## 3.2.4 Without Replacement

SE is multiplied by  $\frac{N-n}{N-1}$ , because  $s^2$  is biased  $s_{\overline{Y}_R}^2 = \frac{1}{n} \frac{N-n}{N-1} \left( R^2 s_x^2 + s_y^2 - 2R s_{xy} \right)$ for  $\sigma^2$ :  $E(\frac{N-1}{N}s^2) = \sigma^2$ , but N is normally An approximate  $1 - \alpha$  C.I. for  $\mu_y$  is  $\overline{Y}_R \pm \left| \frac{\partial l}{\partial \lambda} = \frac{n\alpha}{\lambda} - \sum_{i=1}^n X_i \right|$ large.

### 3.2.5 Confidence Interval

Let  $U \sim \chi_m^2, V \sim \chi_n^2$  be independent, W = | An approximate  $1 - \alpha$  CI for  $\mu$  is  $\left(\overline{x}-z_{\alpha/2}\frac{s}{\sqrt{n}},\overline{x}+z_{\alpha/2}\frac{s}{\sqrt{n}}\right)$ 

### 3.3 Biased Measurements

Let  $X = \mu + \epsilon$ , where  $E(\epsilon) = 0$ ,  $Var(\epsilon) = \sigma^2$ Suppose X is used to measure an unknown constant a,  $a \neq \mu$ .  $X = a + (\mu - a) + \epsilon$ , where  $\mu - a$  is the bias.

Mean square error (MSE) is  $E((X-a)^2) =$  $\sigma^2 + (\mu - a)^2$ 

with n IID measurements,  $\overline{x} = \mu + \overline{\epsilon}$ 

 $E((x-a)^2) = \frac{\sigma^2}{n} + (\mu - a)^2$ 

 $MSE = SE^2 + bias^2$ , hence  $\sqrt{MSE}$  is a good  $N(\mu, \sigma^2)$ :  $\mu = \mu_1, \sigma^2 = \mu_2 - \mu_1^2$ measure of the accuracy of the estimate  $\overline{x}$  of

### 3.4 Estimation of a Ratio

Consider a population of N members, 5and two characteristics are recorded:  $(X_1, Y_1), (X_2, Y_2), ..., (X_n, Y_n), r = \frac{\mu_y}{\mu_x}.$ 

An obvious estimator of r is  $R = \frac{\overline{Y}}{\overline{Y}}$ 

 $Cov(\overline{X}, \overline{Y}) = \frac{\sigma_{xy}}{n}$ , where

 $\sigma_{xy} := \frac{1}{N} \sum_{i=1}^{N} (x_i - \mu_x)(x_i - \mu_y)$  is the population covariance.

## 3.4.1 Properties

 $Var(R) \approx \frac{1}{\mu^2} \left( r^2 \sigma_{\overline{X}}^2 + \sigma_{\overline{Y}}^2 - 2r \sigma_{\overline{X}\overline{Y}} \right)$ 

Population coefficient  $\rho = \frac{\sigma_{xy}}{\sigma_{xy}}$ 

$$\begin{vmatrix} E(R) \approx r + \frac{1}{n} \left( \frac{N-n}{N-1} \right) \frac{1}{\mu_x^2} \left( r \sigma_x^2 - \rho \sigma_x \sigma_y \right) \\ s_{xy} = \frac{1}{n-1} \sum_{i=1}^n \left( X_i - \overline{X} \right) \left( Y_i - \overline{Y} \right) \end{vmatrix}$$

## 3.4.2 Ratio Estimates

 $\overline{Y}_R = \frac{\mu_x}{\overline{Y}} \overline{Y} = \mu_x R$  $Var(\overline{Y}_R) \approx \frac{1}{n} \frac{N-n}{N-1} (r^2 \sigma_x^2 + \sigma_y^2 - 2r \rho \sigma_x \sigma_y)$ 

 $E(\overline{Y}_R) - \mu_y \approx \frac{1}{n} \frac{N-n}{N-1} \frac{1}{\mu_x} \left( r \sigma_x^2 - \rho \sigma_x \sigma_y \right)$ 

The bias is of order  $\frac{1}{n}$ , small compared to its 5.3 Gamma case standard error.

 $|\overline{Y}_R|$  is better than  $\overline{Y}$ , having smaller variance, when  $\rho > \frac{1}{2} \left( \frac{C_x}{C_y} \right)$ , where  $C_i = \sigma_i / \mu_i$ 

Variance of  $\overline{Y}_R$  can be estimated by

 $z_{\alpha/2}s_{\overline{Y}_{\mathcal{P}}}$ 

### 4 Method of Moments

To estimate  $\theta$ , express it as a function of moments  $g(\hat{\mu}_1, \hat{\mu}_2, ...)$ 

### 4.1 Monte Carlo

Monte Carlo is used to generate many realisations of random variable.

 $\overline{X} \xrightarrow[n]{\infty} \alpha/\lambda, \hat{\sigma}^2 \xrightarrow[n]{\infty} \alpha/\lambda^2$ , MOM estimators are consistent (asymptotically unbiased).

Poisson( $\lambda$ ): bias = 0,  $SE \approx \sqrt{\frac{\overline{x}}{n}}$ 

 $\Gamma(\lambda,\alpha)$ :  $\hat{\lambda} = \frac{\hat{\mu}_1}{\hat{\mu}_2 - \hat{\mu}_1^2} = \frac{\overline{X}}{\hat{\sigma}^2}, \hat{\alpha} = \frac{\hat{\mu}_1^2}{\hat{\mu}_2 - \hat{\mu}^2} = \frac{\overline{X}^2}{\hat{\sigma}^2}$ 

# Maximum Likelihood Estimator (MLE)

### 5.1 Poisson Case

 $L(\lambda) = \prod_{i=1}^{n} \frac{\lambda^{x_i} e^{-\lambda}}{x_i!} = \frac{\lambda \sum_{i=1}^{n} x_i e^{-n\lambda}}{\prod_{i=1}^{n} x_i!}$ 

 $l(\lambda) = \sum_{i=1}^{n} x_i \log \lambda - n\lambda - \sum_{i=1}^{n} \log x_i!$ 

ML estimate of  $\lambda_0$  is  $\overline{x}$ . ML estimator is  $\lambda_0 = \overline{X}$ 

## 5.2 Normal case

$$l(\mu, \sigma) = -n \log \sigma - \frac{n \log 2\pi}{2} - \frac{\sum_{i=1}^{n} (X_i - \mu)^2}{2\sigma^2}$$

$$\frac{\partial l}{\partial \mu} = \frac{\sum_{i=1}^{n} (X_i - \mu)}{\sigma^2} \implies \hat{\mu} = \overline{x}$$

$$\frac{\partial l}{\partial \sigma} = \frac{\sum_{i=1}^{n} (X_i - \mu)^2}{\sigma^3} - \frac{n}{\sigma}$$

$$\implies \hat{\sigma}^2 = \frac{1}{n} \sum_{i=1}^{n} (X_i - \overline{X})^2$$

 $l(\theta) = n\alpha \log \lambda + (\alpha - 1) \sum_{i=1}^{n} \log X_i - \lambda \sum_{i=1}^{n} X_i - n \log \Gamma(\alpha)$  $\frac{\partial l}{\partial \alpha} = n \log \alpha + \sum_{i=1}^{n} \log X_i - \sum_{i=1}^{n} X_i - \frac{n}{\Gamma(\alpha)} \Gamma'(\alpha)$ 

### 5.4 Multinomial Case

$$f(x_1,...,x_r) = \binom{n}{x_1,x_2,...x_r} \prod_{i=1}^n p_i^{X_i}$$
 where  $X_i$  is the number of times the value occurs, and not the number of trials. and  $x_1,x_2,...x_r$  are non-negative integers summing to  $n$ .  $\forall i$ :

$$E(X_i) = np_i, Var(X_i) = np_i(1 - p_i)$$

$$Cov(X_i, X_j) = -np_ip_j, \forall i \neq j$$

$$l(p) = + \sum_{i=1}^{r-1} x_i \log p_i + x_r \log(1 - p_1 - \dots p_{r-1})$$

$$\frac{\partial l}{\partial p_i} = \frac{x_i}{p_i} - \frac{x_r}{p_r} = 0 \text{ assuming MLE exists}$$

$$\frac{x_i}{\hat{p}_i} = \frac{x_r}{\hat{p}_r} \implies \hat{p}_i = \frac{x_i}{c}, c = \frac{x_r}{\hat{p}_r}$$

$$\sum_{i=1}^r \hat{p}_i = \sum_{i=1}^r \frac{x_i}{c} = 1$$

$$\implies c = \sum_{i=1}^r x_i = n \implies \hat{p}_i = \frac{\overline{x}_i}{n}$$
same as MOM estimator.

### 5.5 CIs in MLE

$$\begin{split} \frac{\hat{X} - \mu}{s/\sqrt{n}} &\sim t_{n-1} \\ \text{Given the realisations} \quad \overline{x} \quad \text{and} \quad s, \quad \overline{x} \quad \pm \\ t_{n-1,\alpha/2} \frac{s}{\sqrt{n}}, \overline{x} + t_{n-1,\alpha/2} \frac{s}{\sqrt{n}} \text{ is the exact } 1 - \alpha \\ \text{CI for } \mu. \\ \frac{n\hat{\sigma}^2}{\sigma^2} &\sim \chi_{n-1}, \ \frac{n\hat{\sigma}^2}{\chi_{n-1,\alpha/2}^2}, \frac{n\hat{\sigma}^2}{\chi_{n-1,1-\alpha/2}^2} \text{ is the exact } \\ 1 - \alpha \text{ CI for } \sigma. \end{split}$$

## 6 Fisher Information

$$I(\theta) = -E\left(\frac{\partial}{\partial \theta^2} \log f(x|\theta)\right)$$

Distribution	MLE	Variance
$Po(\lambda)$	X	λ
Be(p)	X	p(1-p)
Bin(n,p)	$\frac{X}{n}$	$\frac{p(1-p)}{p}$
HWE tri	$\frac{\stackrel{n}{X_2+2X_3}}{n}$	$\frac{\theta(1-\theta)}{n}$

General trinomial:  $\left(\frac{X_1}{n}, \frac{X_2}{n}\right)$ 

$$\begin{bmatrix} p_1(1-p_1) & -p_1p_2 \\ -p_1p_2 & p_2(1-p_2) \end{bmatrix} \frac{1}{n}$$

In all the above cases,  $var(\hat{\theta}) = I(\theta)^{-1}$ .

As  $n \to \infty$ ,  $\sqrt{nI(\theta)}(\hat{\theta} - \theta) \to N(0,1)$  in distribution, and hence  $\hat{\theta} \sim N\left(\theta, \frac{I(\theta)^{-1}}{n}\right)$ As  $\hat{\theta} \xrightarrow{\infty} \theta$ , MLE is consistent.

SE of an estimate of  $\theta$  is the SD of the esti- The  $(1-\alpha)$  CI for  $\mu$  consists of precisely the 11.1.1 Known Variance  $\underbrace{\text{mator } \hat{\theta}, \text{ hence } SE = SD(\hat{\theta}) = \sqrt{\frac{I(\theta)^{-1}}{n}}}_{\text{against } H_1 + \mu \neq \mu_0} \approx \left| \text{values } \mu_0 \text{ for which } H_0 : \mu = \mu_0 \text{ is not rejected} \atop \text{overlaptice} \right| Z := \frac{\bar{X} - \bar{Y} - (\mu_X - \mu_Y)}{\sigma \sqrt{\frac{1}{n} + \frac{1}{m}}} \text{ and reject } H_0 \text{ when } |Z| > 1$  $\sqrt{\frac{I(\hat{\theta})^{-1}}{1}}$  $1 - \alpha \text{ CI } \approx \hat{\theta} \pm z_{\alpha/2} \sqrt{\frac{I(\theta)^{-1}}{2}}$ 

# 8 Sufficiency

### 8.1 Characterisation

Let  $S_t = x : T(x) = t =$ . The sample space possible values of T.

T is sufficient for  $\theta$  if  $\exists q()$  s.t.  $\forall x$  $S_t, f_{\theta}(X|T=t) = q(x).$ 

### 8.2 Factorisation Theorem

T is sufficient for  $\theta$  iff  $\exists q(t,\theta), h(x)$  s.t.  $\forall \theta \in$  $\Theta, f_{\theta}(x) = g(T(x), \theta)h(x) \forall x$ 

### 8.3 Rao-Blackwell Theorem

Let  $\hat{\theta}$  be an estimator of  $\theta$  with finite variance, 10.1 Large-sample null distribution of T be sufficient for  $\theta$ . Let  $\tilde{\theta} = E[\hat{\theta}|T]$ . Then for every  $\theta \in \Theta$ ,  $E(\hat{\theta} - \theta)^2 \le E(\hat{\theta} - \theta)^2$ Equality holds iff  $\hat{\theta}$  is a function of T.

## 8.4 Random Conditional Expectation

- 1. E(X) = E(E(X|T))
- 2. var(X) = var(E(X|T)) + E(var(X|T))
- 3.  $var(Y|X) = E(Y^2|X) E(Y|X)^2$
- 4. E(Y) = Y, var(Y) = 0 iff Y is a constant

# 9 Hypothesis Testing

Let  $X_1...X_n$  be IID with density  $f(x|\theta)$ . null  $H_0: \theta = \theta_0, H - 1: \theta = \theta_1$ . Critical region is 10.2 Poisson Dispersion Test  $R_n$ .  $size = P_0(X \in R)$  and  $power = P_1(X \in For i = 1...n let <math>X_i \sim Poisson(\lambda_i)$  are inde-R).

 $x:\Lambda(x)< c_{\alpha}$ , and among all tests with this  $w_1=\{\tilde{\lambda}|\lambda_i\neq\lambda_j \text{ for some } i,j\}$ size, it has the maximum power (Neyman-Pearson Lemma).

A hypothesis is simple if it completely specifies the distibution of the data.

7 Asymptotic Normality of MLE  $|H_1: \mu > \mu_0$ : Critical region  $\{\bar{x} > \mu_0 + z_\alpha \frac{\sigma}{\sqrt{n}}\}$ the power is a function of  $\mu$ , and this is uni- 11.1 Normal Theory: Same Variance formly the most powerful test for size  $< \alpha$ .  $H_1: \mu \neq \mu_0$ : Critical region  $\{|\bar{x} - \mu_0| > c\}, c = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ independent. } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_Y, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_Y = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X - \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X = |\text{i.i.d } N(\mu_X, \sigma^2), \text{ i.i.d } H_0: \mu_X = |\text{i.i.d } H_0: \mu_X = |\text{i.i.d } H_0: \mu_X = |\text{i.i.d } H_0:$  $z_{\frac{\alpha}{2}} \frac{\sigma}{\sqrt{n}}$ , but not uniformly most powerful.

against  $H_1: \mu \neq \mu_0$ . Exact for normal with known variance, approx. in others.

## 9.1 p-value

the probability under  $H_0$  that the test statistic is more extreme than the realisation. (A. B):  $p = p_0(\bar{X} > \bar{x}) = P(Z > \frac{\bar{x} - \mu_0}{\sigma / \sqrt{n}})$ . (C): of X, S is the disjoint union of  $S_t$  across all  $p = P_0(|\bar{X} - \mu_0| > |\bar{x} - \mu_0|)$ . The smaller the p-value, the more suspicious one should  $\in$  be about  $H_0$ . If size is smaller than p-value, do not reject  $H_0$ .

## 10 Generalized Likelihood Ratio 11.1.3 CI

is to 0, the stronger the evidence for  $H_1$ .

Normal (C): 
$$p = P\left(\chi_1^2 > \frac{(\bar{x} - \mu_0)^2}{\sigma^2/n}\right)$$

Multinomial:  $\Lambda = \prod_{i=1}^r \left(\frac{E_i}{X_i}\right)_i^X$  where  $E_i =$  where  $a = \frac{s_X^2}{n}$  and  $b = \frac{s_Y^2}{m}$  $np_i(\hat{\theta})$  is the expected frequency of the ith 11.2 Mann-Whitney Test event under  $H_0$ .  $-2 \log \Lambda \approx \sum_{i=1}^r \frac{(X_i - E_i)^2}{E_i}$ , which is the Pearson chi-square statistic, written as  $X^2$ .

pendent.

Critical region 
$$w_0 = {\tilde{\lambda} | \lambda_1 = \lambda_2 = ... = \lambda_n}$$
  
1 tests with this  $w_1 = {\tilde{\lambda} | \lambda_i \neq \lambda_i}$  for some  $i, j$ 

 $-2\log\Lambda \approx \frac{\sum_{i=1}^{n}(X_{i}-\bar{X})^{2}}{\bar{X}}$ . For large n, the null distribution of  $-2 \log \Lambda$  is approximately  $\chi_{n-1}^2$ 

# Comparing 2 samples

 $X_1, ..., X_n$  be i.i.d  $N(\mu_X, \sigma^2)$  and  $Y_1, ..., Y_m$  be

### 11.1.2 Unknown Variance

 $s_p^2 = \frac{(n-1)s_X^2 + (m-1)s_Y^2}{m+n-2}$  where  $\$s_X^2 = \frac{(n-1)\sum_{i=1}^n}{n-1\sum_{i=1}^n} (X_{i-1})^2$ .  $s_p^2$  is an unbiased estimator of  $\sigma^2$ .  $s_X$  within factor of 2 from  $s_Y$ .

 $t := \frac{\bar{X} - \bar{Y} - (\mu_X - \mu_Y)}{s_p \sqrt{\frac{1}{n} + \frac{1}{m}}}$  follows a t distribution with m+n-2 d.f.

If two-sided: reject  $H_0$  when  $|t| > t_{n+m-2,\alpha/2}$ . If one-sided, e.g  $H_1: \mu_X > \mu_Y$ , reject  $H_0$  when  $t > t_{n+m-2,\alpha}$ .

 $\Lambda^* = \frac{\max_{\theta \in \omega_0} L(\theta)}{\max_{\theta \in \Omega} L(\theta)}, \ \Omega = \omega_0 \cup \omega_1. \ \text{The closer } \Lambda \left| \frac{\bar{X} - \bar{Y}}{\pm} z_{\alpha/2} \cdot \sigma \sqrt{\frac{1}{n} + \frac{1}{m}} \right| \text{ if } \sigma \text{ is known, or } \sigma = 0$  $\frac{\bar{X}-\bar{Y}}{+}t_{m+n-2,\alpha/2}\cdot s_p\sqrt{\frac{1}{n}+\frac{1}{m}}$  if  $\sigma$  is unknown.

## 11.1.4 Unequal Variance

$$\begin{array}{l}
\Lambda \\
\text{Under } H_0, \text{ when n is large, } -2\log\Lambda = \chi_k^2, \\
\text{where } k = \dim(\Omega) - \dim(\omega_0). \\
\text{Normal (C): } p = P\left(\chi_1^2 > \frac{(\bar{x} - \mu_0)^2}{\sigma^2/n}\right) \\
\text{In this problem is large, } -2\log\Lambda = \chi_k^2, \\
\text{Where } k = \frac{\bar{X} - \bar{Y} - (\mu_X - \mu_Y)}{\sqrt{\frac{s_X^2}{n} + \frac{s_Y^2}{m}}}, \text{ with } df = \frac{(a+b)^2}{\frac{a^2}{n-1} + \frac{b^2}{m-1}} \\
\text{Where } a = \frac{s_X^2 \text{ and } b = \frac{s_Y^2}{n}}{\sqrt{\frac{s_X^2}{n} + \frac{s_Y^2}{m}}}, \text{ where } a = \frac{s_X^2}{n} \text{ and } b = \frac{s_Y^2}{n}
\end{array}$$

We take the smaller sample of size  $n_1$ , and sum the ranks in that sample.  $R' = n_1(m +$ (n+1)-R, and R\*=min(R',R), we reject  $H_0: F = G \text{ if } R* \text{ is too small.}$ 

Test works for all distributions, and is robust to outliers.

## 11.3 Paired Samples

 $(X_i, Y_i)$  are paired and related to the same individual.  $(X_i, Y_i)$  is independent from  $(X_i, Y_i)$ . Compute  $D_i = Y_i - X_i$ , To test  $H_0: \mu_D = d, t = \frac{D - \mu_D}{s_D/\sqrt{n}}$ 

 $1 - \alpha \text{ CI: } \bar{D} \pm t_{n-1,\alpha/2} S_D / \sqrt{n}$ 

### 11.4 Ranked Test

 $W_{+}$  is the sum of ranks among all positive  $D_i$  and  $W_i$  is the sum of ranks among all Inegative  $D_i$ . We want to reject  $H_0$  if W = $min(W_{+}, W_{-})$  is too large.
